

Module Name: JAVA Logic Placement Preparation Test 6

Batch: PG-DAC

Q.1) Print unique unsorted array → Accept data in an array having duplicate value. You need to print unique array using only 2 loop .

Input → 3, 5, 3, 7, 9, 7, 3, 1 output → 1, 3, 5, 7, 9

Q.2) **Rearrange an array in maximum minimum form using Two Pointer Technique**

Given a sorted array of positive integers, rearrange the array alternately i.e first element should be a maximum value, at second position minimum value, at third position second max, at fourth position second min, and so on.

Examples:

Input: `arr[] = {1, 2, 3, 4, 5, 6, 7}`

Output: `arr[] = {7, 1, 6, 2, 5, 3, 4}`

Explanation: First 7 is the max value, then 1 is the min value, then 6 is the second max value, then 2 is the second min value, then 5 is the third max value, then 3 is the third min value and at last 4 is the fourth max value.

Input: `arr[] = {1, 2, 3, 4, 5, 6}`

Output: `arr[] = {6, 1, 5, 2, 4, 3}`
